

Lange version drunter

Klar — hier ist die **kurze, klare Version**:

Die 18-Punkte-Datei ist unser **internes Master-Blueprint**.

Sie erklärt, **wie das Affiliate-Programm grundsätzlich aufgebaut ist**, welche Regeln gelten, was erlaubt ist, was verboten ist, wie Referrals, Tiers, Disclosures, Monitoring, Tax und Privacy funktionieren und wie das Ganze eingeführt werden soll.

Die 8 Dokumente sind die **vollständigen Hauptdokumente**, die aus diesem Blueprint gebaut wurden.

Dort stehen die **genauen Regeln, Prozesse, Pflichten und Kontrollen** drin. Sie sind die eigentliche Arbeitsgrundlage für Management, Compliance, Operations, Finance, Product und Legal Review.

Die 8 Website-ready Texte sind die **verkürzte Nutzer- und Produktversion** dieser Dokumente.

Sie sind für **Website, Onboarding, FAQ, Checkboxes, Tooltips, Warnings und Support-Texte** gedacht.

Die Reihenfolge ist immer:

18 Punkte = Logik und Struktur

8 Dokumente = vollständige Regeln und Prozesse

8 Website-Texte = nutzerfreundliche Darstellung dieser Regeln

Wichtig:

- **Website-Texte sind nicht die Quelle der Wahrheit**
- **die 8 Dokumente dürfen nicht einfach 1:1 auf die Website kopiert werden**
- **die 18 Punkte sind das Fundament für alles**

Für Developer heißt das:

- **18 Punkte** = wie das System gedacht ist
- **8 Dokumente** = welche Regeln technisch umgesetzt werden müssen
- **8 Website-Texte** = welche Texte Nutzer später sehen sollen

A. Objective of this point

Ein klarer interner Erklärungstext für Team, Developer, Product, Operations und Management, damit jeder versteht:

1. was die **18-Punkte-Datei** ist,
2. was die **8 Hauptdokumente** sind,
3. was die **8 Website-ready / Product-ready Textsets** sind,
4. wie diese drei Ebenen zusammenhängen,
5. und wie im Team damit gearbeitet werden soll.

B. Key assumptions

- Die **18 Punkte** sind das interne Blueprint-, Governance- und Source-of-Truth-Dokument.
- Die **8 Dokumente** sind die vollständigen fachlichen, operativen und rechtlich strukturierten Hauptdokumente.
- Die **8 Website-ready Textsets** sind die abgeleiteten öffentlichen bzw. produktseitigen Kurzfassungen für Website, Onboarding, UX und Support.
- Die Website-ready Texte dürfen die Bedeutung der 8 Hauptdokumente **nicht verändern**, sondern nur für Nutzer verständlich und umsetzbar machen.
- Interne SOPs und interne Kontrolllogik sind **nicht automatisch öffentlich**.

C. Full internal/professional draft

Internal explanation for team and developers

How to use the POOOL Affiliate Program document structure

This project is intentionally structured into **three layers**.

These three layers serve different purposes and should **not** be confused or merged.

1. The “18 Points” file

What it is

The **18 Points file** is the **internal blueprint** of the POOOL Affiliate Program.

It is the document that explains the full architecture of the program:

- what the program is,

- what it is not,
- what affiliates may do,
- what affiliates may not do,
- how qualification works,
- how tiers work,
- how onboarding works,
- where disclosures must appear,
- how tax, privacy, monitoring, suspension, and clawback must be handled,
- and in what order the whole system should go live.

What it is for

This file is the **strategic and operational source of truth**.

It is mainly used for:

- founders and management alignment,
- legal/compliance review preparation,
- product and system design guidance,
- developer implementation logic,
- internal decision-making,
- and future consistency checks.

What it is not

The 18 Points file is **not** the final public website text.

It is also **not** the final contract set for affiliates.

It is the **master framework** behind everything else.

How the team should use it

Use the 18 Points file when you need to answer questions like:

- What is the intended structure of the program?
- Is a certain feature or behavior allowed?
- Should this be public, internal, or embedded in product flow?
- Does a document or UI text still match the approved model?
- How should engineering, compliance, and product interpret the rules?

If there is a conflict between other working drafts, the **18 Points file should be checked first**.

2. The 8 main documents

What they are

The **8 main documents** are the full policy, legal, operational, and governance documents that turn the blueprint into usable formal materials.

These documents are the actual working document stack of the program.

They include the full rules, definitions, obligations, controls, procedures, and internal handling logic needed to run the affiliate program properly.

What they are for

These documents are used for:

- affiliate onboarding and acceptance,
- internal compliance and operations,
- finance and payout control,
- complaint handling,
- monitoring and enforcement,
- privacy and tax handling,
- approved marketing usage,
- and legal review.

What they are not

The 8 main documents are **not** meant to be copied 1:1 onto the website. They are usually too detailed, too long, and too operational for public-facing use.

They are the **full reference layer**.

How the team should use them

The team should use the 8 main documents as the **official operational and policy documents**.

That means:

- Product should use them to understand logic and user flows.
- Developers should use them to understand system rules, gating, statuses, permissions, and evidence requirements.
- Operations should use them for actual handling and decisions.
- Compliance and legal should use them for review and control.
- Support should use them as reference, not as public copy.

Important rule:

The 8 main documents are where the **real program meaning** sits.

If any public text, dashboard wording, onboarding wording, or support wording conflicts with these documents, the conflict must be corrected.

3. The 8 website-ready / product-ready text sets

What they are

The **8 website-ready text sets** are the simplified, user-facing implementation layer derived from the 8 main documents.

These texts are written for:

- website pages,
- landing pages,
- affiliate onboarding screens,
- registration flow,
- referral flow,
- checkboxes,
- disclosure placements,
- tooltips,
- warnings,
- support macros,
- and product UX surfaces.

What they are for

They exist so that the rules can actually be shown inside the product and website in a clear, concise, trust-building way.

They are the **communication layer**, not the governance layer.

What they are not

They are **not** the source of truth.

They are **not** a substitute for the full documents.

They should **not** quietly change legal or operational meaning.

They should **not** expose internal-only SOPs or backend logic unless explicitly intended.

How the team should use them

Use the website-ready texts when building:

- website copy,
- help center content,
- onboarding flows,
- checkbox language,
- user warnings,
- status explanations,
- payout explanations,
- disclosure screens,
- dashboard info areas,
- and support-facing short responses.

Developers and designers should treat these texts as the **approved user-facing layer**.

If a UI needs wording, it should generally come from this layer, not from the full documents.

How all three layers work together

The relationship is simple:

Layer 1

18 Points file

= blueprint / architecture / source of truth

Layer 2

8 main documents

= full formal implementation of the blueprint

Layer 3

8 website-ready text sets

= public/product-facing wording derived from the main documents

In short:

18 Points -> 8 Main Documents -> 8 Website/Product Text Sets

That is the intended hierarchy.

Practical working rule for the team

When working on any feature, content block, flow, or policy question, use this order:

If you need program logic or policy intent

Check the **18 Points** file

If you need the full rule, obligation, or procedure

Check the relevant **main document**

If you need wording for users or UI

Use the relevant **website-ready text set**

Practical working rule for developers

Developers should not build from scattered chat outputs.

Developers should work from:

1. the approved logic in the **18 Points blueprint**,
2. the detailed rule set in the relevant **main document**,
3. and the final approved wording in the **website-ready text set**.

Examples:

- If building affiliate onboarding, use:
 - onboarding logic from the blueprint,
 - acceptance requirements from the relevant full document,
 - and final screen text from the website-ready layer.
 - If building payout status logic, use:
 - qualification/payable logic from the blueprint,
 - detailed payout control rules from the relevant policy,
 - and final user-facing status wording from the website-ready layer.
 - If building disclosures, use:
 - placement logic from the blueprint,
 - full disclosure requirements from the relevant document,
 - and display text from the website-ready layer.
-

Important protection rule

These three layers must stay separated.

Do not:

- replace the full document with website copy,
- publish internal-only SOP content by accident,
- build from old chat drafts instead of approved files,
- or change legal/operational meaning through UX simplification.

If something is unclear, the correct process is:

1. check the 18 Points blueprint,
2. check the relevant full document,
3. then adjust the website/product wording if needed.

Final internal summary

- The **18 Points file** is the internal master framework.
- The **8 main documents** are the formal rule and operations layer.
- The **8 website-ready text sets** are the user-facing implementation layer.
- The website layer must follow the main documents.
- The main documents must follow the 18 Points blueprint.
- The 18 Points blueprint is the top-level reference for consistency.

D. Short customer-facing / website-facing version

Nicht relevant als externer Kundentext.

Stattdessen hier eine kurze **team-facing short version**:

Short internal explanation

We use three document layers for the POOOL Affiliate Program:

1. **18 Points file**
Our internal blueprint and source of truth. It defines the full program architecture, rules, boundaries, controls, and launch logic.
2. **8 Main Documents**
Our full legal, operational, and governance documents. These contain the actual detailed rules, obligations, procedures, and control logic.

3. **8 Website/Product Text Sets**

Our user-facing implementation layer for website, onboarding, UX, FAQ, disclosures, checkboxes, and support wording.

Working rule:

Blueprint defines the model. Main documents define the rules. Website texts define the user wording.

E. Required UI text / checkbox text / disclosure text (if relevant)

Suggested internal handover note for Notion / Slack / project docs

Important working rule for all teams:

Do not treat website copy as the policy source of truth.

Do not treat internal policy documents as website copy.

Use the document stack in this order:

18 Points Blueprint -> Main Documents -> Website/Product Texts

Suggested developer handover note

Developer note:

When implementing affiliate features, always separate:

- business logic,
- policy/control logic,
- and user-facing wording.

Use:

- the **18 Points file** for architecture,
- the **main documents** for formal rules,
- the **website-ready texts** for UI wording.

F. Operational / backend / implementation notes

Recommended internal use by function

Founders / Management

Use the **18 Points file** and the **8 main documents** for alignment, approvals, and escalation decisions.

Compliance / Legal

Use all three layers, but treat:

- **18 Points** as framework,
- **8 main documents** as primary review layer,
- **website texts** as controlled public-expression layer.

Product / UX

Use:

- blueprint for flow logic,
- full documents for rule meaning,
- website-ready texts for final visible wording.

Developers

Use:

- blueprint for system architecture,
- full documents for gating, statuses, permissions, logging, evidence, and control flows,
- website-ready texts for labels, warnings, disclosure placements, and UI copy.

Operations / Support

Use:

- main documents for decision-making,
- website-ready texts for user-facing messaging,
- do not improvise wording that changes meaning.

Recommended final storage structure

- **01_Internal_Blueprint**
 - POOOL Affiliate Program Blueprint
- **02_Main_Documents**
 - 8 standalone full documents
- **03_Website_Product_Copy**
 - 8 website-ready text sets
 - later optionally consolidated into one implementation pack
- **04_Legal_Review_and_Launch_Control**
 - legal review list
 - launch checklist

- visibility matrix
- unresolved placeholders

G. Open legal-review items

- None specific to this explanatory note.
- For clarity, this explanation should be treated as an **internal operating explanation**, not as a legal document.
- Final public/internal visibility of some materials should still follow the approved visibility model and legal review.

H. Final recommended version

Recommended final internal explanation text

The POOOL Affiliate Program is structured into three separate document layers so the team can work clearly and consistently.

First, the 18 Points file is the internal blueprint. It defines the overall architecture of the program, including scope, boundaries, qualification logic, tier logic, onboarding logic, disclosure placement, monitoring, tax, privacy, enforcement, and go-live structure. It is the main source of truth for how the program is supposed to work.

Second, the 8 main documents are the full formal documents built from that blueprint. They contain the detailed rules, obligations, definitions, procedures, and controls needed to operate the affiliate program properly. These are the core policy and operational documents used by management, compliance, operations, finance, product, support, and legal review.

Third, the 8 website-ready / product-ready text sets are the simplified user-facing versions derived from the main documents. They are used for website pages, onboarding, disclosures, checkboxes, dashboard explanations, tooltips, FAQs, and support messaging. Their job is to communicate the approved rules clearly to users without changing the meaning of the underlying documents.

The working hierarchy is:

18 Points Blueprint -> 8 Main Documents -> 8 Website/Product Text Sets

This means:

- the blueprint defines the model,
- the main documents define the rules,
- and the website/product texts define how those rules are shown to users.

For internal work, never use website text as the source of truth.

For public communication, never copy full policy documents directly into the user interface.

When in doubt, always check the blueprint first, then the relevant main document, and only then the related website/product wording.

I. Ask whether to continue with the next point

Do you want me to continue with the next point?
